Questions For Individual Project Making Ready

```
const index = useRef(0);
console.log(index); // { current: 0 }
```

Why do we use `useRef`, not a variable or state? Select all that are correct.

1. If we had used a normal variable like `let index = 0`, that variable would reset to 0 on every re-render.
2. If we used `useState` instead of `useRef`, then every time we incremented the index, React would re-render again — unnecessary and wasteful.
